

Exercises #19

[2*] 1. Define and implement classes for representing *time* and *rational numbers*. declare and define constructors and some simple member functions as interfaces. Use default arguments for reducing the number of constructors.

[1*] 2. Consider the following class:

```
class X {  
public:  
    int mf(int v);  
private: // Implementation  
    int m;  
};
```

Write the body of the mf member function, so set m with v, but return the old value of m.
